ADO to GitHub: VDI setup and first prompts

For: C:\repos\ADO-GIT on the VDI, VS Code with GitHub Copilot. Date: 11 Nov 2026.

What this does: puts the three Copilot kits into one VS Code workspace, signs you in to GitHub and Azure DevOps, and runs the first prompts so Copilot can build the timeline, your call notes and the inventory.

1. What you need

- **Files:** copilot-migration.zip, copilot-artifacts.zip, copilot-timeline.zip (or the unzipped folders) and Setup-AdoGitWorkspace.ps1, all in C:\repos\ADO-GIT.
- **VS Code** with the GitHub Copilot and Copilot Chat extensions, signed in to cencora.ghe.com.
- **Tools:** git, GitHub CLI (gh), Azure CLI (az). Optional: Docker, git filter-repo, gitleaks. The setup check in step 5 tells you what is missing.
- **An Azure DevOps PAT** (step 4). Never paste it into Copilot Chat.

2. Arrange the workspace (one script)

Open PowerShell (or the VS Code terminal) and run:

```
cd C:\repos\ADO-GIT
Set-ExecutionPolicy -Scope Process Bypass
.\Setup-AdoGitWorkspace.ps1
```

The script unzips the kits, copies their prompts, instructions, scripts and docs to the top of C:\repos\ADO-GIT (Copilot only reads the .github folder there), and lists what it installed. It only copies; it deletes nothing. You should end up with:

```
C:\repos\ADO-GIT\
  .github\copilot-instructions.md      main rules for Copilot
  .github\instructions\                 artifacts + timeline rules
  .github\prompts\                      about 21 prompt files (/plan-chart, /inventory-all
...)
  .github\workflows\                    Actions Importer audit workflow
  .vscode\mcp.json                      optional ADO + GitHub connections for Copilot
  scripts\  docs\  rulesets\  templates\
  copilot-migration\  copilot-artifacts\  copilot-timeline\   (originals, can stay)
```

Then open .github\copilot-instructions.md and replace "AnalyticsDataHub (confirm)" with your ADO organization name (the part after dev.azure.com/). The script warns you if this is still there.

3. Open it in VS Code

1. File > Open Folder > C:\repos\ADO-GIT.
2. Settings (Ctrl+,) > search github-enterprise.uri > enter https://cencora.ghe.com. Sign in from the Accounts icon (bottom left) with your GHE.com account.
3. Ctrl+Shift+P > Reload Window.
4. Open Copilot Chat (Ctrl+Alt+I). In the mode dropdown under the chat box choose Agent.

5. Type / in the chat box. You should see /plan-chart, /inventory-all, /weekly-update and the others. If not: Settings > search "prompt files" > turn on Chat: Prompt Files, then Reload Window.

4. Sign in (VS Code terminal, Ctrl+`)

```
# GitHub on cencora.ghe.com
gh auth login --hostname cencora.ghe.com
gh auth status --hostname cencora.ghe.com

# Azure DevOps PAT (lasts only for this terminal window)
$env:ADO_PAT = Read-Host 'Paste ADO PAT'

# Azure, needed later for service connection roles (optional today)
az login
az account show
```

PAT scopes: Create the ADO PAT in Azure DevOps > User settings > Personal access tokens. Give it Read on: Code, Build, Release, Service Connections, Variable Groups, Secure Files, Environment, Agent Pools, Task Groups, Packaging, Project and Team, Graph, Identity. Expiry: 30 days.

MCP: The servers in .vscode\mcp.json are optional. If your admin has not enabled MCP servers for Copilot, skip them; the prompts use the scripts and gh instead.

5. Prompts to run, in order

Paste each into Copilot Chat in Agent mode. Copilot shows every terminal command before it runs it: read it, then click Continue.

a. Check the setup

> Check my setup for the migration kit. In the terminal, run git --version, gh --version, gh auth status --hostname cencora.ghe.com, az --version, $PSVersionTable.PSVersion and docker --version, and check $env:ADO_PAT is set without printing it. Then call https://dev.azure.com/<my-org>/_apis/projects?api-version=7.1 with the PAT and list the project names. Give me a table of what works and what is missing, and what to install or ask for.

b. Timeline for tonight's call (no ADO access needed)

> /plan-chart

Copilot writes docs\migration\status\<date>-timeline.md. Open it and press Ctrl+Shift+V to see the chart. If you see code instead of a chart, install the "Markdown Preview Mermaid Support" extension or open the file on cencora.ghe.com. The dates come from docs\migration\plan-12-week.md; edit that file if the plan changes.

c. Notes for tonight's call

> Read docs/migration/plan-12-week.md and the two sections I paste below. Write docs/migration/status/<today>-call-notes.md with: what was done last week, what is blocked (runners need org-level rights; I only have repo admin), the access asks with who must grant each, and the plan for the next 2 weeks. One page, plain English. [paste the "Tonight's call" and "Access to request this week" sections from the 12-week guide here]

d. Inventory (needs the ADO PAT; can run after the call)

> /inventory-all

Then, in order: /plan-waves, then /artifacts-inventory. Clone the ADO repos into a separate folder such as C:\repos\ado-clones (not inside ADO-GIT) when Copilot asks for a clone folder.

e. Every week

```
/weekly-update

/plan-chart with status
```

6. After that: follow the guide

Each step of the 12-week guide names its prompt:

Step	Prompts
1 Inventory	/inventory-all, /plan-waves
2 Runners	/runner-tools
3 Service connections to OIDC	/oidc-plan
4 Variable groups and secure files	/library-plan
5 Permissions, rulesets, CODEOWNERS	/permissions-plan
6 Repo migration	/repo-verify
7 Modules, tags, versions	/module-split, /module-tags
8 Artifacts feeds	/artifacts-inventory, /artifacts-plan, /package-migrate
9 Pipelines	/pipeline-patterns, /pipeline-convert
10 Scanning	/scan-history, /security-report
11 Logs	/migration-log
12 Cutover	/cutover-check
Every week	/weekly-update, /plan-chart

7. If something goes wrong

- **Scripts blocked:** run Set-ExecutionPolicy -Scope Process Bypass in that terminal.
- **Prompts not listed after typing /:** check the files are in C:\repos\ADO-GIT\.github\prompts, turn on Chat: Prompt Files, Reload Window.
- **"mode: agent" warning in a prompt file:** newer VS Code uses "agent: agent". Change that one line.
- **A script reports failed calls:** ask Copilot "Read the errors.csv next to the output and tell me which PAT scope is missing, then fix the script if the URL is wrong." The scripts have not been run against your ADO org before, so the first run is also their test.
- **gh says not logged in:** add --hostname cencora.ghe.com, or set $env:GH_HOST = "cencora.ghe.com".
- **No Docker on the VDI:** Actions Importer runs from the workflow .github\workflows\actions-importer-audit.yml instead (step 1 of the guide).
- **Use /plan-chart, not /migration-timeline,** until docs\migration\baseline-plan.md is updated: it still has the old 32-week dates.
